$236,451 per door

Federal civil penalty per repeat ADA violation, after the July 2025 Federal Register inflation adjustment.

8,800 federal Title III lawsuits were filed in 2024 (Seyfarth Shaw tracker), continuing a sustained 9k-11k baseline since 2018.

Manual audits cost $800-$50,000+ per facility and take days. The math does not close.

$118,225

first violation

$236,451

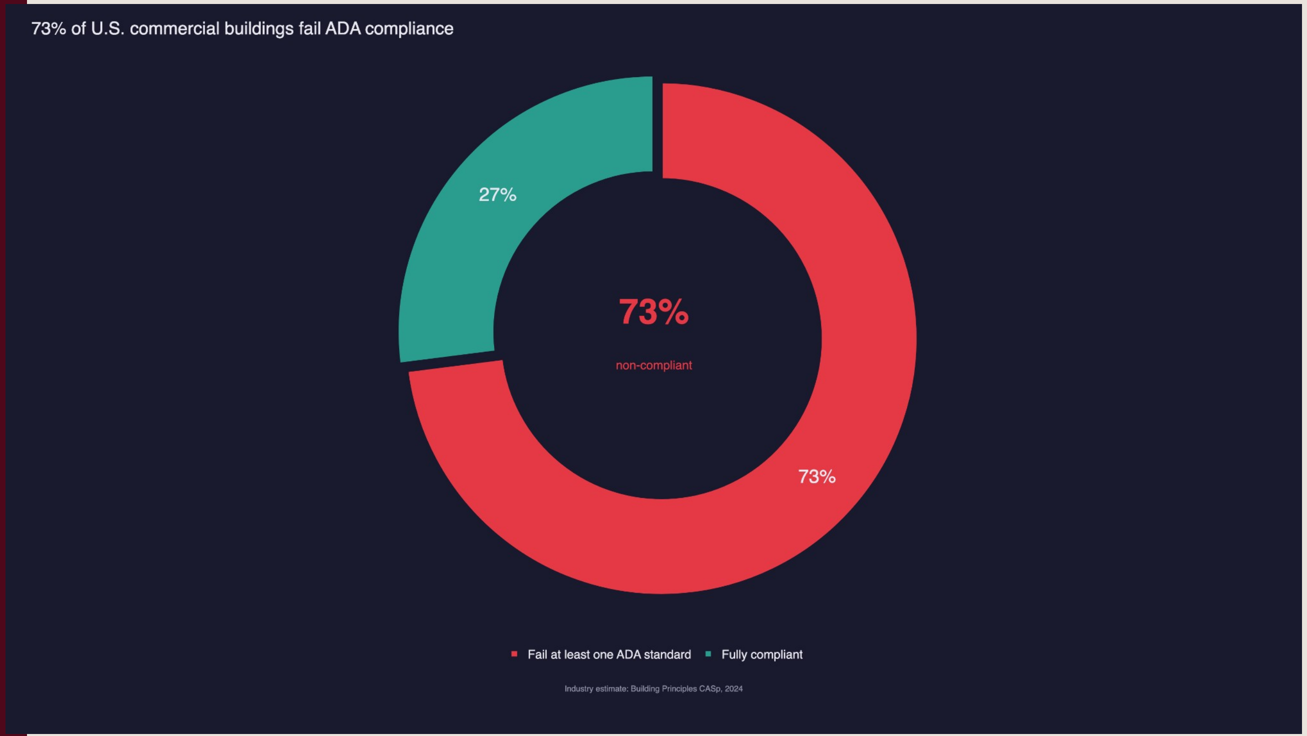
each subsequent

Who measures this?

73 percent of public-facing facilities fail at least one ADA standard at survey.

31 million U.S. adults (12.2 percent) report mobility disabilities, per CDC.

Only 32 percent of U.S. property buyers ask about ADA compliance during diligence.

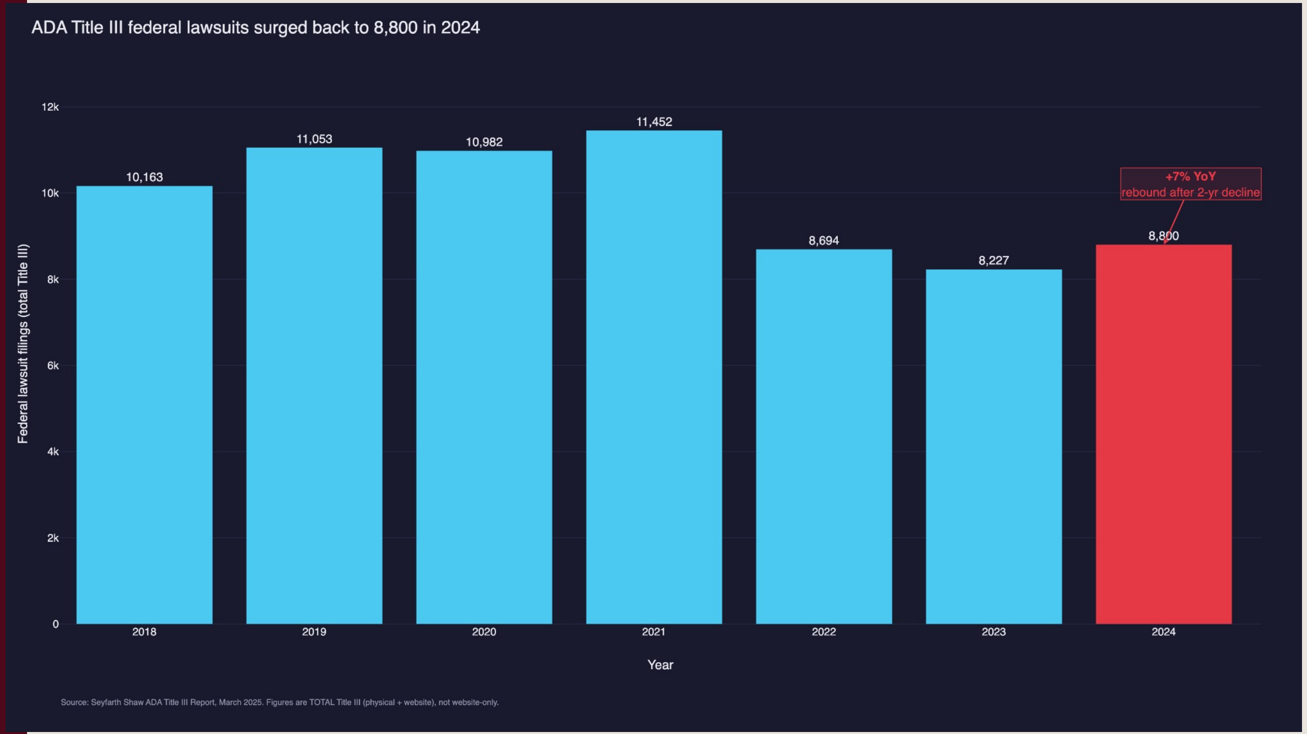


Enforcement is accelerating

Federal Title III filings: 10,163 (2018) -> peak 11,452 (2021) -> rebounded to 8,800 in 2024.

California leads with 3,252 filings in 2024; Texas filed 224.

Title II web-accessibility deadline (April 2026 for state and local) drove a 7 percent year-over-year increase.



Tech stack

HARDWARE

RPLiDAR C1 (12 m, IP54)

IMX219-83 stereo cameras

BNO055 IMU, HC-SR04 sonar

Renesas RX72N (240 MHz)

Raspberry Pi 5

DRV8263H driver x4

5S 18650 battery pack

SOFTWARE

ROS 2 Jazzy on Ubuntu 24.04

slam_toolbox (async)

Nav2 + DWB controller

robot_localization EKF

Go gateway with nanopb

Python compliance engine

C23 firmware on ThreadX

VALIDATION

60 firmware ctests, 100 pct libs/

74.0 pct Go gateway cov, gate 65

14 ROS 2 colcon tests

12 compliance pytest modules

9 manual PCB validation checks

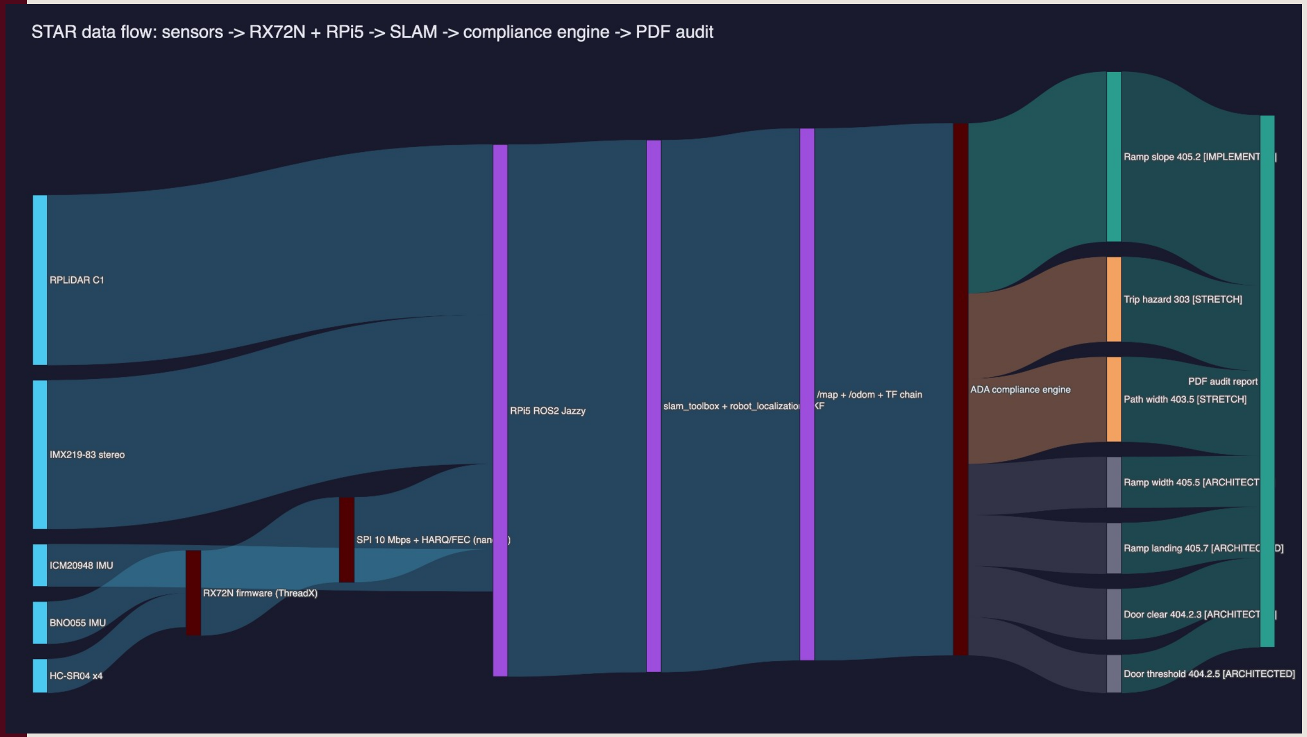
Wixey WR300 +/- 0.1 deg ground truth

System architecture

Sensors feed the RX72N for hard-real-time motor control at 250 Hz.

RX72N talks to the Pi 5 over a framed transport: SPI 10 MHz with FEC and HARQ is the architected production link; USB-CDC ASCII at 115200 baud is the deployed link for capstone defense.

Pi 5 runs slam_toolbox, robot_localization EKF, and Nav2. The compliance engine reads the fused map and emits a structured PDF report.



Seven ADA checks

IMPLEMENTED

Ramp slope (ADA 405.2)

RANSAC plane on LiDAR + BNO055 pitch cross-validation

Threshold 4.76 deg (1:12)

STRETCH

Trip hazard (ADA 303): vertical discontinuity > 1/4 in

Path width (ADA 403.5): cross-section along planned route

ARCHITECTED

Ramp width (405.5)

Ramp landings (405.7)

Door clear width (404.2.3)

Door threshold (404.2.5)

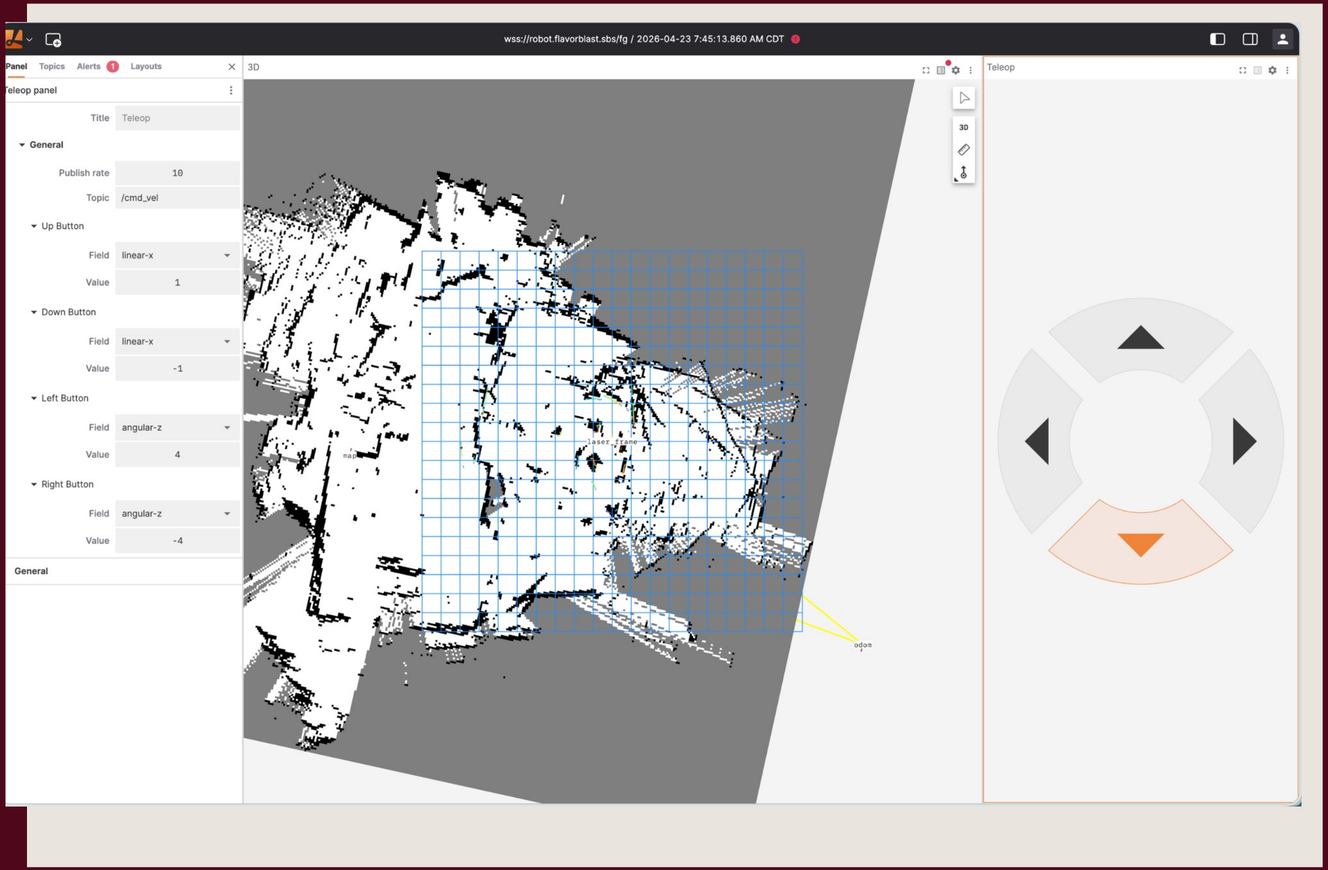
Node skeletons committed; bodies pending

Live demo

Robot is dispatched in MANUAL via the Grafana cockpit, then handed to AUTONOMY for frontier exploration.

On approach to a ramp, the compliance engine fits a RANSAC plane and cross-validates pitch against the BNO055.

When measured slope > 4.76 deg, the engine logs a violation flag with the ground-truth row in the PDF audit report.

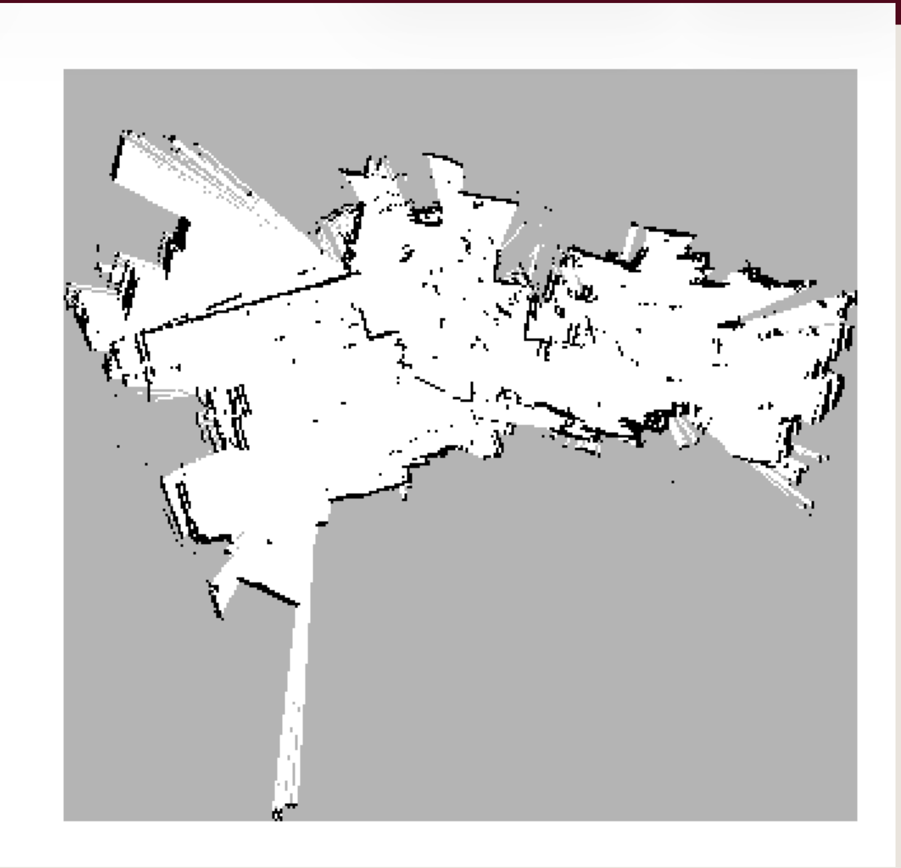


Validation

Software: 60 firmware ctests (100 pct libs/), 74 pct Go gateway, 14 ROS 2 tests, 12 pytest modules.

Hardware: 9 manual PCB checks all PASS -- continuity, motor free-spin + loaded chassis with DC current, scoped PWM, AD2-probed comm.

Field: 200 sq ft autonomous scan in Thompson Hall (right). Two issues detected: slope > 1:12, path < 36 in.

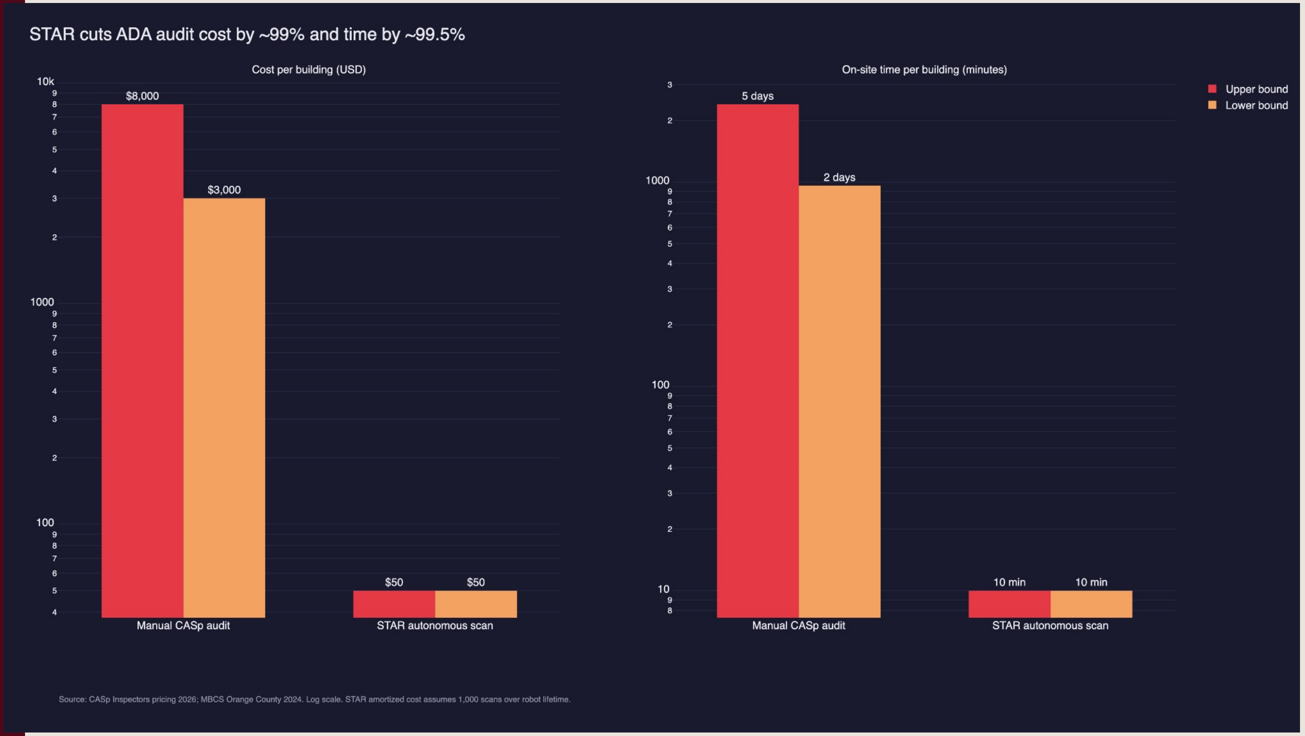


Cost

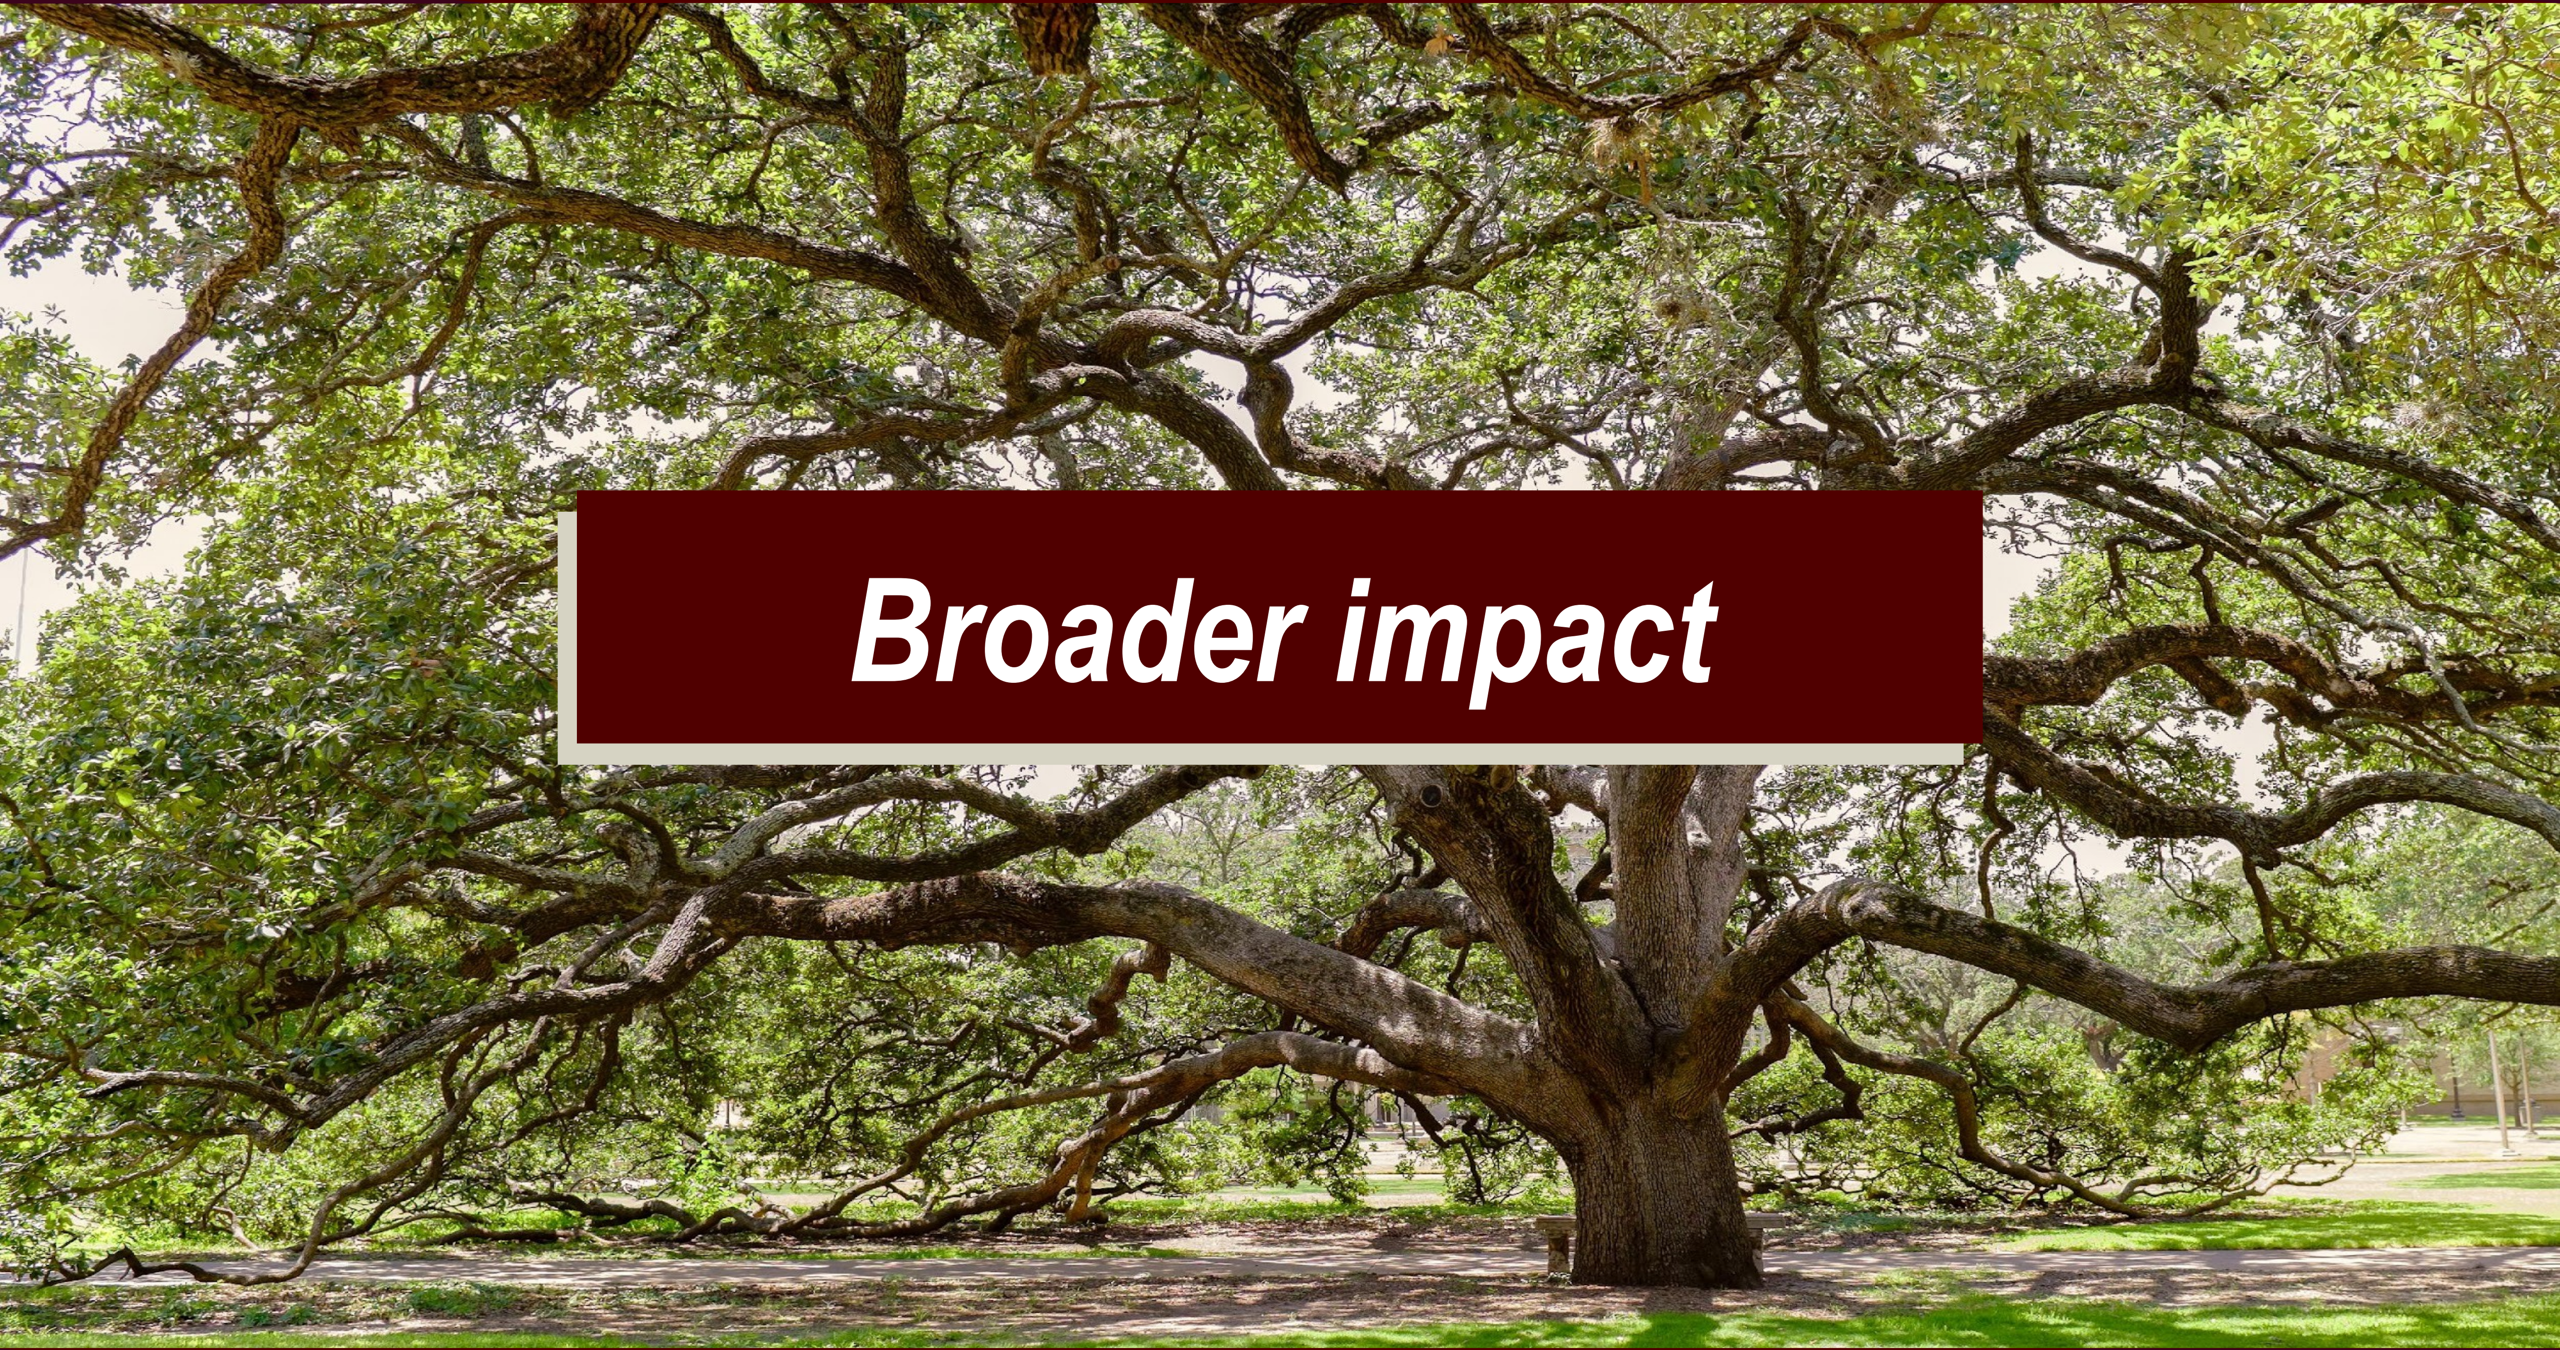
Total BOM: ~$864 with PCB run, well under the $2,000 capstone target.

Compute $182 (Pi 5, RX72N, PCB) - Sensors $270 (LiDAR, stereo, IMU, sonar) - Drivetrain $144 (motors, drivers, wheels) - Power $108 (battery, BMS, regulators) - Chassis $100

Daxbot service-as-a-product is $920k for 950 surveyed miles. STAR is sub-$2k recurring near-zero. Different economics entirely.



Broader impact



Future work

- Implement architected ADA checks: ramp width, ramp landing, door clear width, door threshold.
- Sensor fusion via RTAB-Map for richer 3D reconstruction.
- Multi-floor support with elevator detection and floor handoff.
- ML-based fixture recognition for fire extinguishers, signage, hardware.
- Outdoor GPS plus RTK for campus-scale audit campaigns.

Q&A and team

SOFTWARE

Cesar Magana, Project Manager

proto, gateway, ROS 2, UI, MATLAB

EMBEDDED AND PCB

Brighton Sikarskie

firmware, compliance engine, infra, schematic

Jeremie Hockey, PCB layout
