STAR Grafana Dashboard

Rendered Snapshot

*Visual representations of every panel in the
monitoring/grafana-star-dashboard.json dashboard.*

Generated by `scripts/render-grafana-json.py`
using offline PIL rendering with synthetic demo data.

To capture screenshots of the production dashboard with live
Prometheus data, deploy via `monitoring/docker-compose.yml`
and use the grafana-image-renderer plugin.

Dashboard Overview

STAR robot telemetry

Composite of all rows

Per-Row Composites

Row 0: SLAM map

All panels in this row, arranged on the Grafana 24-column grid

Row 1: Motors

All panels in this row, arranged on the Grafana 24-column grid

Row 2: IMU

All panels in this row, arranged on the Grafana 24-column grid

Row 3: Odometry

All panels in this row, arranged on the Grafana 24-column grid

Row 4: LiDAR

All panels in this row, arranged on the Grafana 24-column grid

Row 5: Bridge health

All panels in this row, arranged on the Grafana 24-column grid

```
1 # STAR infra -- Pi5-side system files
2
3 Non-ROS infra I manage on the Pi5 itself (outside the ROS workspace). These
4 are mirrored here so they live in version control, but the authoritative
5 copies are the ones deployed at the paths below.
6
7 ## Layout
8
9 ...
10 infra/pi5/
11 +-- opt/
12 |   +-- star_cockpit_api/
13 |   +-- server.py           -> /opt/star_cockpit_api/server.py
14 +-- etc/
15     +-- caddy/
16     |   +-- Caddyfile       -> /etc/caddy/Caddyfile
17     +-- systemd/system/
18         +-- caddy.service   -> /etc/systemd/system/caddy.service
19         +-- star-cockpit-api.service -> /etc/systemd/system/star-cockpit-api.service
20         +-- star-slam-mvp.service -> /etc/systemd/system/star-slam-mvp.service
21     ...
22
23 ## What each piece does
24
25 ### `star_cockpit_api` -- HTTP API backing the Grafana cockpit controls
26
27 A standalone Python rclpy node + HTTP server on `100.64.0.6:9102`.
28
29 Endpoints:
30
31 | Method | Path | Purpose |
32 |-----|-----|-----|
33 | GET | `/api/state` | `{autonomy, estop, speed, slam}` -- all cached |
34 | POST | `/api/autonomy/toggle` | flip `/star/autonomy_enable` |
35 | POST | `/api/estop/toggle` | flip `/star/estop` |
36 | POST | `/api/speed` | body `{"value":0.75}` -> publish `/star/speed_scale` |
37 | POST | `/api/cmd_vel` | body `{"linear":0.5,"angular":0}` -> publish `/cmd_vel` |
38 | POST | `/api/slam/start` | configure+activate `/slam_toolbox` |
39 | POST | `/api/slam/stop` | deactivate `/slam_toolbox` |
40
41 Subscribes to the latched `/star/state/*` topics so the toggle logic always
42 sees the supervisor's current view. A background thread refreshes the slam
43 lifecycle state every 4s (via `ros2 service call`) so `/api/state` is 0(1).
44
45 ### Systemd units
46
47 - **`caddy.service`** -- Caddy (on Pi5) listens on `100.64.0.6:443`, terminates
48   TLS with its own local CA (`tls internal`), fronts `star_simple_bridge` on
49   `:9101` and `star_cockpit_api` on `:9102`. `After=tailscaled.service` so it
50   waits for the tailscale IP to be assigned. `Restart=always`.
51
52 - **`star-cockpit-api.service`** -- runs `server.py` as the `star` user, with
53   ROS workspace sourced and Cyclone DDS config exported. Restart on failure.
54
55 - **`star-slam-mvp.service`** -- runs `scripts/slam-mvp.sh start` at boot
56   (after tailscale is up + an 8s USB-enumeration delay). Initial state is
57   MANUAL mode, e-stop cleared -- so the robot is safe on boot, operator
58   flips to AUTONOMY via the Grafana cockpit toggle.
59
60 ### `Caddyfile`
61
62 Pi5-side Caddy config. Uses `tls internal` -- no ACME, no Cloudflare, no
63 external CA. Laptop/phone clients install Caddy's local root CA once (see
64 `docs/ARCHITECTURE.md` -> "Client setup to use `star.local`"). No secrets.
65
66 ## Installing on a fresh Pi5
67
68 ```bash
69 # 1. Copy files (from repo root)
70 sudo cp infra/pi5/opt/star_cockpit_api/server.py /opt/star_cockpit_api/
71 sudo chmod +x /opt/star_cockpit_api/server.py
72
73 sudo cp infra/pi5/etc/caddy/Caddyfile /etc/caddy/Caddyfile
74 sudo cp infra/pi5/etc/systemd/system/*.service /etc/systemd/system/
75
```

```

76 # 2. Install Caddy binary with no plugins needed (tls internal only)
77 sudo curl -fsSL -o /usr/local/bin/caddy \
78 "https://caddyserver.com/api/download?os=linux&arch=arm64"
79 sudo chmod +x /usr/local/bin/caddy
80 sudo useradd --system --shell /usr/sbin/nologin --home-dir /var/lib/caddy caddy 2>/dev/null || true
81 sudo mkdir -p /var/log/caddy /var/lib/caddy
82 sudo chown caddy:caddy /var/log/caddy /var/lib/caddy
83
84 # 3. Enable + start
85 sudo systemctl daemon-reload
86 sudo systemctl enable --now caddy star-cockpit-api star-slam-mvp
87 ...
88
89 ## What is deliberately NOT mirrored here
90
91 - **Cluster-side k8s manifests** (traefik, robot-gateway, lichtblick, grafana
92   dashboard JSON). Those live in k3s's etcd; Grafana dashboard is pushed via
93   API. They can be exported separately if needed.
94 - **Any hostname or credentials** -- these system files use only `star.local`
95   and `100.64.0.6` (tailscale IP), nothing that identifies the operator.
96 - **The Caddy-gateway Caddyfile block on pve** that defines
97   `` -- that contains the public hostname and a bcrypt
98   password hash, and is managed on the homelab host, not on the Pi5.
